JOB MARKET PAPER

“Gains from Trade with Competitive Effects”

This article studies the domestic gains from trade using a model with variable markups and multiple sectors in an Input-Output structure. I find the domestic gains from trade are larger with variable markups, and decrease the higher the cost pass-through. Computing the model to the US in 1997 and 2007, I quantify the gains from trade to be 6.1%. In this period, the pro-competitive effect dominates the anti-competitive effects, with markups decreasing in all markets. This is a first approximation to general equilibrium models with both competitive effects of imports, and their interaction with the gains from trade.
